ZatPark – Stand F36

ZatStats

ZatStats is a brand new, AppleTV based application that enables ZatPark clients to view their real-time company statistics in a clear and concise manner on a TV screen in their offices. It is completely and simply customisable by the end user, allowing different teams within an organisation to view the business information that is most applicable to them. All that is needed is a 4th or 5th generation AppleTV and a TV screen.

The user - friendly, drag and drop interface allows ZatPark clients to pick from a constantly growing range of modules to customise a holistic view of how all the most important areas of their business are performing, including monitoring ANPR cameras so any outages can be dealt with immediately.

Featured modules include:

- Top performing employees (based on tickets issued per operative)
- Top performing sites (based on tickets issued per site)
- ANPR tickets (number of all tickets being processed)
- Live ANPR camera video streaming
- ANPR Camera monitoring and outage alert (immediately deal with any issues such as connectivity to help to protect revenue streams)
- Tickets Issued
- Revenue
- Appeals (appeals received, declined and approved)
- Documents (number of system generated notices produced)
- DVLA requests (number of DVLA requests sent and the number that have been returned and a further breakdown of any errors/issues)

All information is in real-time and automatically updates allowing an end user to respond immediately to any issues. ZatPark developers are currently working on new modules and will be responding to client requests when planning future developments.
